

NAI Product Wizards

NAI introduces on-line product configurators. The Power Supply and I/O Wizards assist customers in locating products to meet specific system I/O and power supply requirements.

The NAI Power Supply Wizard allows a customer to generate a specific NAI Power Supply part number based on their power supply input and output parameters. By defining certain mechanical and electrical requirements, a customer can determine which NAI power supply is able to meet their application. The more fields that can be specified, the more tailored the list of applicable power supply part numbers returned. In addition the customer can submit a request for a modified COTS Solution.

The I/O Wizard is more than a product configurator; it is an application wizard, allowing a customer to specify their total I/O requirement for the complete system. The I/O Wizard allows a customer to enter their overall I/O requirements. It will configure the actual part number and quantity of boards required to satisfy the requirement. Also, the I/O wizard does not just simply populate the multifunction boards randomly, but takes thermal, power requirements and many other parameters into account before returning actual part numbers which can be used to request a quote.

After going through the process of configuring either a Power Supply or I/O requirement, a customer can download product documentation, available software and request a quote.
